**RE: Proposed Burger King Restaurant
106 & 110 River Road (Route 12)
Lisbon, Connecticut
Our File # 20110**

Dear Mr. Muirhead:

Pursuant to your request our office has prepared this report to document our findings of the potential traffic impact of a proposed 2,877 s.f. Burger King Restaurant with a drive through window to be located at 106/110 River Road (Route 12) in the Town of Lisbon, Connecticut. The site location is presented in Figure 1 with respect to the surrounding roadway network. This report is written to present our findings.

Proposed Development

The proposed Burger King is depicted on plans prepared by our office dated May 3, 2021. The site plan shows a single 2,877 s.f. building in the center of the site. The building has a dual drive through window located in the northern portion of the building. A drive through lane circulates the building in a counterclockwise direction. Access to the site is proposed by way of a single driveway to River Road. The proposed site driveway will provide a single, separated, entering and exiting lane and will operate under stop sign control.

Description of Area

The site proposed for development is located on Route 12 (River Road) across from an existing gas station, near the I-395 southbound on and off ramps. Route 12 (River

Road) is a state-maintained highway that originates in Groton and traverses north until it enters Massachusetts. Route 12 enters Lisbon traversing north from Norwich and continues north past a junction with Interstate 395, past the proposed site development, and continues north into Griswold. The roadway provides approximately 40 feet of pavement with a single travel lane and painted shoulder in each direction separated by a painted double yellow centerline. Left-turn lanes are provided along the roadway at commercial driveways. The posted speed limit is 35 miles per hour. Land use along the roadway is commercial uses with single-family residences located north of the junction with interstate 395.

Current Traffic Volumes

The Connecticut DOT maintains a traffic volume count program on all state highways and some local roadways. Included within the DOT database are counts on Route 12, located north of the I-395 southbound on-ramp and another located north of the I-395 northbound off ramp. The count north of the I-395 southbound on-ramp, conducted during October 2017, indicated that Route 12 carries an average daily traffic volume (ADT) of 10,200 vehicles with peak hour volumes of 647 vehicles during the a.m. peak hour (9:00 a.m.) and 967 vehicles during the p.m. peak hour (3:00 p.m.). The count north of the I-395 northbound off-ramp, conducted during October 2017, indicated that Route 12 carries an average daily traffic volume (ADT) of 10,400 vehicles with peak hour volumes of 682 vehicles during the a.m. peak hour (9:00 a.m.) and 1050 vehicles during the p.m. peak hour (4:00 p.m.). The ConnDOT counts are presented in Table 1 and 2.

Manual turning movement counts were conducted during the morning, afternoon and Saturday peak hours at both the I - 395 northbound and southbound on/off-ramps. The counts were conducted during February 2020. The observed traffic volumes are presented in Figures 2, 3 and 4. Copies of the counts are included in the appendix.

A review of the past ConnDOT ADTs revealed that traffic volumes have decreased in the area over the past 6 years. The counts at station 46 indicated traffic volumes have decreased approximately 4% from 2014 to 2017. The count at station 57 indicated traffic volumes have decreased approximately 17% from 2011 to 2017.

In order to be conservative, we have not applied a growth rate factor to the existing 2020 traffic volumes. The resultant volumes represent the 2022 background traffic volumes. These volumes are presented in Figures 5, 6 and 7.

Site Generated Traffic and Traffic Assignment

The proposed development is to consist of a 2,877 s.f. Burger King restaurant with a drive-thru window. The trip generation for the development was calculated utilizing the ITE Trip Generation report. Included in the ITE Trip Generation report is a land use that is directly applicable to the proposed development. The land use utilized for this report is the following: LUC 934 - Fast Food Restaurant with drive thru window.

Using the ITE trip generation report, based on square footage our development is anticipated to have a weekday average daily traffic of 1,356, with 147 peak morning trips made up of 76 entering trips and 71 exiting trips, an afternoon peak of 148 trips made up of 75 entering trips and 73 exiting trips, a Saturday average daily traffic of 1,774 trips, with 158 Saturday peak trips made up of 81 entering trips and 77 exiting trips. The trip generation summary can be found in Table 3.

Capacity Analysis

Capacity analyses were conducted for the morning, afternoon, and Saturday peak hours at the intersection of Route 12 and the I-395 northbound off ramp, the Route 12 and I-395 southbound ramps, the intersection of Route 12 and a gas station entrance, and the intersection of Route 12 with the proposed site entrance drive and exit drive. An

analysis was completed for the background and combined traffic volume conditions.

The results of the analysis are presented in Table 4 and discussed below.

Route 12 at I-395 Southbound Ramps – This is an existing signalized T-intersection with Route 12 oriented in the north-south direction and the I-395 southbound ramps approaching from the east. The route 12 approaches each provide three lanes, two through lanes and an exclusive left-turn lane for the southbound approach, and right-turn lane for the northbound approach. The I-395 southbound approach provides three lanes consisting of two left-turn lanes and one right-turn lane. The analysis indicates that the intersection operates at an overall LOS (level of service) A under both the background and combined conditions during the morning peak hour. During the afternoon peak hour, under background conditions the intersection operates at a LOS A, and with the introduction of site traffic, operates at a LOS B. During the Saturday peak hours the intersection operates at a LOS B under background conditions, and at a LOS C under the combined conditions.

Route 12 at I-395 Northbound Ramps – This is an existing signalized four-way intersection with Route 12 oriented in the north-south direction and the I-395 northbound ramps oriented in the east-west direction. The route 12 northbound approach provides a through-lane and dedicated left-turn lane and the southbound approach provides a through-lane and a right -turn permitted through lane. The I-395 northbound ramp approaches from the east and west provide a single right-turn only lane. The analysis indicates the intersection operates at a LOS B under all conditions.

Route 12 at Gas Station Entrance – This is a existing, unsignalized intersection with Route 12 oriented in the north-south direction and the gas station entrance approaching from the east. The route 12 southbound approach provides two through lanes with one permitting left-turns into the gas station, and the northbound approach is a single

through lane which permits right-turns into the gas station. Analysis indicates that the driveway will operate at a LOS A under all conditions.

Route 12 at Site Drive Entrance – This is a proposed, unsignalized intersection, with Route 12 oriented in the north-south direction and the site entrance approaching from the east. Analysis indicates the driveway will operate at a LOS A under all conditions.

Route 12 at Site Drive Exit – This is a proposed, unsignalized intersection, with Route 12 oriented in the north-south direction and the site entrance approaching from the east. The site drive operates under stop-sign control. Analysis indicates the site drive will operate at a LOS C during the morning and afternoon peak hours and at a LOS D during the afternoon peak hours.

Site Driveway Location and Design

The Connecticut Department of Transportation has published its requirements for the application of sight distances at intersections and driveways as adopted in December of 2003. In general, the intersection sight distance (ISD) is the available sight distance allowing a driver approaching an intersection to observe the vehicles on the crossing roadway or opposing direction. Therefore, the ISD varies according to the speed of traffic and distance crossed while performing the maneuver. The clear line of sight is measured from a minimum of 15 feet behind the edge of road or traveled way to a point within the road, while the ISD is the line of sight projected along the length of the roadway. The line should be measured at a height of 3 feet 6 inches from the beginning point (driver's eye level) to the end point (object in roadway.)

The proposed driveways will be located on Route 12 (River Road) across from the existing Mobile driveways. The northern driveway will be a one-way exit, and the southern drive will provide a single entering and exiting travel lane separated by a raised median. The speed limit on Route 12 in the vicinity of the proposed development

is 35 miles per hour. The ConnDOT minimum required ISD for a speed of 35 miles per hour is 390 feet. Our observations at the proposed site driveway locations indicates that the available sight lines are in excess of the required 390 feet.

Drive Thru Queuing

A standard Poisson queue analysis was conducted for the proposed drive through window to determine the required vehicle stacking distance for this site. The results of that analysis are presented in Table 4, 5 and 6. The analysis was conducted based on a service rate of 35 and 45 seconds per vehicle (103 and 80 veh/hr) and a peak hour volume of 81 vehicles. The analysis indicates for a service rate of 35 seconds with 65% of the entering vehicles using the drive-thru queue would be 2 vehicles with an average waiting time of 55 seconds per vehicle. The probability that the queue would exceed fifteen (15) vehicles is approximately 1%. For a service rate of 45 seconds with 65% of the entering vehicles using the drive-thru the queue would be 4 vehicles with an average waiting time of 167 seconds per vehicle. The probability that the queue would exceed fifteen (15) vehicles is approximately 2%. Due to the pandemic, we ran a scenario in which there was no sit-down dining or access into the Burger King, therefore all entering vehicles would utilize the drive-thru window.

The drive-thru was analyzed for a service rate of 35 seconds with 100% of the entering vehicles using the drive-thru. The analysis found the drive-thru queue would be 4 vehicles with an average waiting time of 129 seconds. The probability that the queue would exceed fifteen (15) vehicles is approximately 3%.

The proposed site plan provides approximately 325 ft amount of vehicle storage. The available storage is capable of accommodating thirteen (13) vehicles at an average of 25 feet per vehicle.

Accident Experience

The University of Connecticut gathers and compiles traffic accident data for all state highways and some major local roadways. A list of accidents occurring in the area from January 1st, 2017 through February 5th, 2020 includes the most recent 3 years of available data. Tables relating the accidents to various conditions including date, time, roadway and weather conditions, collision types, and other variables as well as a short description of each accident are included in the appendix.

Accident records were obtained for Route 12 for a distance of 1,000 feet either side of the proposed site driveway. The 3-year accident history indicates a total of twenty-seven (27) accidents. Of those accidents, twelve (23) were front-to-rear accidents, eleven (11) were angled crashes, two (2) were categorized as other, one (1) was a sideswipe same direction crash and one (1) was a sideswipe opposite direction crash. Those crashes resulted in twenty-three (23) property damage only crashes, three (3) crashes involving suspected injuries and one (1) crash resulting in possible injuries. There were no reported fatalities.

Conclusion

Based on our analysis, it is our professional opinion that the traffic volumes associated with the proposed Burger King Restaurant can readily be accommodated by the existing roadway network. The proposed site driveway is properly located with respect to adjacent intersections and with respect to available sight distances and are properly designed to accommodate the anticipated driveway volumes.

We appreciate the opportunity to provide this analysis to you. We will be available to offer testimony in support of your application before local planning agencies upon your request. If you require additional information regarding this application, please do not hesitate to contact our office.
